Confidentiality and document-status notice

This Investor Master Blueprint has been prepared by Creative Design Networks as a confidential discussion document regarding a proposed capital-raising program for Sphere of Kings (collectively, "the Company"). It is circulated to a limited number of qualified parties for the sole purpose of evaluating the proposed opportunity. It is **not** an offer to sell or a solicitation of an offer to buy any security.

Status of the proposed $100 million capital raise

The $100 million figure represents the Company's proposed capital-raising target. As of the date of this document, that capital has **not** been committed, offered, or approved by any investor, syndicate, or financial institution. References to Rabbit Capital, Shark Ready, Jellop, or any other third party in subsequent sections describe discussions, engagements, or marketing relationships; they do not represent an investment commitment, endorsement, or approval of any kind. Investment terms, valuation, ownership percentages, timing, and participation remain subject to negotiation, documentation, professional review, and the execution of binding definitive agreements.

Nature of the information presented

The information in this Blueprint is drawn from internal management records, product-development materials, and the existing Sphere of Kings codebase and brand system. Throughout the document, we distinguish between four classes of information using colored labels in the margin:

> **VERIFIED** Drawn directly from the project repository, product catalog, or other inspected evidence.

> **MANAGEMENT-PROVIDED** Supplied by the founder; not yet independently validated.

> **ILLUSTRATIVE** Planning scenarios or sensitivity math used to describe potential outcomes.

> **REQUIRES CONFIRMATION** An item that must be resolved before external investor submission.

Financial information

All financial projections, revenue targets, EBITDA targets, valuation estimates, production capacity figures, equipment payback calculations, and investor return scenarios are **illustrative management targets** unless expressly identified as verified. They are not forecasts, not audited, not reviewed by independent accountants, and not endorsed by any investment bank, placement agent, or regulator. Actual results may differ materially from the figures presented, and investors in early-stage private offerings may lose some or all of their capital.

Regulatory

This document does not constitute legal, tax, accounting, investment, or securities advice. Any investor should obtain independent qualified professional advice before making any decision. Any future offering of securities by the Company will be made only pursuant to definitive offering documents, applicable securities laws, and the direct authorization of the Company.

Confidentiality

The recipient of this document agrees to (i) hold its contents in strict confidence, (ii) use the contents solely to evaluate the proposed opportunity, (iii) not disclose, copy, or redistribute any part of the document without the prior written consent of Creative Design Networks, and (iv) return or destroy the document on request. Unauthorized use, reproduction, or distribution is prohibited.

© 2026 Creative Design Networks. All rights reserved. Sphere of Kings is a trademark of Creative Design Networks (registration pending).

01. Appendix A — Expanded 300-question diligence set 35

02. Appendix B — Glossary & source notes 52

03. Appendix C — Document control 53

PART I

Investment overview

The proposition in one place: what Sphere of Kings is, what the proposed $100 million would build, and why a vertically-integrated gaming-plus-manufacturing enterprise is the thesis under evaluation.

1 · Executive investment summary

Sphere of Kings ("SOK") is a modular spherical gaming system developed by Creative Design Networks. It launches on Kickstarter on **November 19, 2026**, with seven product experiences assembled around a single spherical game board: Royal Checkers, Imperial Kings, a pre-designed puzzle, a custom-upload puzzle, a DIY paint puzzle, paintable Royal Checkers, and paintable Imperial Kings.

The investment proposition is not the launch of a single consumer product. It is the staged construction of a vertically-integrated enterprise that uses SOK as the flagship product of a broader manufacturing, licensing, and technology company. The proposed $100 million would fund four connected divisions:

DIVISION A

Sphere of Kings Gaming

Spherical game boards, seven game experiences, puzzle sets, custom artwork, collectibles, accessories, and a digital companion play layer.

DIVISION B

Polymer Manufacturing & Mass Production

Industrial 3D printing, prototyping, injection molding, assembly, finishing, and contract production for outside customers.

DIVISION C

Advanced Metal Manufacturing

Metal additive manufacturing, CNC machining, tooling, industrial prototyping, and qualified specialized metal components.

DIVISION D

Technology, Licensing & Digital Platforms

Design intake, automated quoting, MES, customer management, creator royalties, digital gaming, and manufacturing analytics.

PROPOSED RAISE
$100M
Staged over five tranches

YEAR-5 REVENUE AMBITION
$250M
Illustrative, divisional build

YEAR-5 EBITDA AMBITION
$50M
20% target margin

> **INVESTMENT STATUS** The $100M is a **proposed capital-raising target**, not confirmed funding. The revenue, profitability, manufacturing capacity, valuation, and investor return figures throughout this document are illustrative management targets — not verified forecasts and not guaranteed results. See the companion *Source and Assumption Register* for a line-by-line provenance.

What this document asks the reader to evaluate

1. Whether the four divisions, operated together, produce more value than four specialized businesses.
2. Whether the five-stage capital plan ($2M · $8M · $20M · $30M · $40M) is milestone-gated in a way that protects later tranches from being released without validated results.
3. Whether the gaming division's unit economics can produce the Year-5 revenue implied by the plan.
4. Whether the manufacturing divisions can build a qualified industrial customer pipeline independent of SOK's own demand.

5. Whether the proposed ownership and valuation structure is reasonable in the context of this stage of development.

2 · Company and project overview

The Company's legal parent for the Sphere of Kings program is **Creative Design Networks**, led by founder **James Scott Bowser**. The operating project is the Sphere of Kings product line and its proposed expansion into advanced manufacturing. Formal confirmation of the corporate structure, including whether Sphere of Kings will operate as a division, subsidiary, or separate legal entity, is one of the items in the Outstanding Information Register in Part VI.

Current state of the project (as verified in the repository)

ASSET	STATUS	EVIDENCE
Brand identity & design system	VERIFIED	Tokenized palette and typography in `nextjs/lib/theme.ts`; Cinzel and Inter typefaces locally hosted
Product catalog art	VERIFIED	36 product images in `nextjs/public/images/products/`, covering the full 7-in-1 lineup and pack configurations
Consumer-facing Next.js application	VERIFIED	Next 15 app with Stripe, MongoDB, Pusher, Three.js integrations and a playable 3D sphere game shell
Platform policy & ADRs	VERIFIED	Six architecture-decision records (seams, 2D MVP, tournaments, Pusher, minimum age 13, parental consent)
Kickstarter launch window	VERIFIED	November 19, 2026, declared in application metadata
Sponsorship program	VERIFIED	Sponsor dashboard shipped in commit `bc72406`
Direct-to-consumer storefront	PROPOSED	Repo currently runs in "Kickstarter-only mode"; direct sales deferred until post-launch (commit `7679016`)
Polymer print farm at warehouse scale	PROPOSED	Not operating; part of Stage 2 of the capital plan
Metal additive capacity	PROPOSED	No equipment procured; Stage 3 dependency
Creator marketplace & licensing platform	PROPOSED	Scope outlined; platform not built

3 · Vision, mission, and long-term opportunity

Vision

To build a vertically integrated creative-manufacturing enterprise that treats the spherical game board as the first in a long-tail of physical and digital products, served by a flexible production network capable of manufacturing both SOK-branded items and outside industrial contracts on the same equipment.

Mission

Combine distinctive, collectible consumer products with disciplined, qualified industrial production. Use software to connect design intake, pricing, scheduling, quality, royalties, and fulfillment across both consumer and industrial customers.

The long-term opportunity

The strategic logic is that most consumer-product businesses either (a) outsource manufacturing and lose margin and control, or (b) build captive manufacturing that is idle outside of their own product's demand cycle. The Company's thesis is that a flexible print-and-mold network can be utilized by SOK's own products *and* by outside contract customers, giving the manufacturing division diversified demand that is not exposed to the risk of a single gaming SKU's success or failure.

> **THESIS UNDER TEST** Investors should evaluate whether running Gaming + Manufacturing + Licensing + Technology together creates more value than running four specialized businesses. This document is structured so that each division can be evaluated on its own economics first, and the integration benefit second. The Company does not claim integration benefits are automatic.

What success looks like

1. **Year 1 — Validation.** Sphere of Kings is manufactured, delivered, and sold at a positive contribution margin; Kickstarter cohort is fulfilled; investor-ready financial records exist.
2. **Year 2 — Commercial launch.** A right-sized warehouse operation produces at planned yield; initial industrial contract customers have been signed on a pilot basis.
3. **Year 3 — Industrial expansion.** High-volume manufacturing is operating; the metal pilot has produced qualified parts for a first set of industrial customers.
4. **Year 4 — Regional scaling.** Contract manufacturing capacity has been expanded; licensing revenue is growing from authorized creator programs.
5. **Year 5 — Global expansion.** Proven operations scale into selective international markets; the enterprise generates sustainable operating cash flow.

4 · Investment opportunity and the proposed $100M raise

The Company is preparing a **proposed $100 million capital-raising program** over five stages. The staging is intentional: each tranche is to be contractually gated by measurable development, operational, and commercial milestones so that later-stage capital is not released on a calendar.

STAGE 1 · VALIDATION

$2M

Prove product economics & production reliability. Deliver first Kickstarter cohort.

STAGE 2 · COMMERCIAL LAUNCH

$8M

Right-sized warehouse; polymer pilot at scale; first industrial pilot customer.

STAGE 3 · INDUSTRIAL EXPANSION

$20M

Injection molding, CNC, and metal additive pilots after contract evidence.

STAGE 4 · REGIONAL SCALING

$30M

Expand qualified contract manufacturing; secondary facility if demand supports.

STAGE 5 · GLOBAL EXPANSION

$40M

Scale proven operations; selective international markets; acquisition options.

The core principle: milestone gating

Each stage is proposed to release only when the prior stage has produced documented, verifiable evidence — not when a calendar date has passed. Suggested gating criteria for discussion:

STAGE	REPRESENTATIVE RELEASE MILESTONE (ILLUSTRATIVE)
1 → 2	First 2,500 SOK units manufactured and shipped at target margin; audited opening balance sheet
2 → 3	Polymer farm operating at ≥60% target utilization for 90 consecutive days; one signed industrial pilot customer
3 → 4	Injection-molding tooling for flagship SKU validated; first qualified metal part delivered; trailing six-month gross margin above a pre-agreed floor
4 → 5	Trailing twelve-month revenue above a pre-agreed floor; two region-specific customer validations; audited financial statements

IMPORTANT References elsewhere in this document to "Rabbit Capital" and "Shark Ready" describe discussions and introductions only. The Company has no commitment letter, term sheet, or signed investment agreement in place as of the date of this Blueprint. Any such agreement will be executed through counsel and reflected in a revised version of this document.

5 · Strategic investment thesis

Thesis in one paragraph

A branded consumer product (Sphere of Kings) provides the initial demand, the visible brand, and the first production commitments. The same manufacturing capacity — polymer printing, injection molding, CNC, metal additive — is sold to outside industrial customers to fill utilization gaps and diversify revenue. A software layer coordinates both. Licensing and digital products are the long-tail extension of the brand. If any single division underperforms, the others can continue; if every division performs, the whole is larger than the sum of its parts.

Five reasons the thesis is worth testing

1. **Differentiated consumer anchor.** The spherical form factor and seven-in-one design are distinctive in a category (board games, puzzles, collectibles) that rewards novelty.
2. **Flexible production economics.** Additive manufacturing supports customization at low minimum volume; mass production handles the standard SKUs; metal additive opens premium and industrial markets.
3. **Two-sided demand.** The manufacturing division is not reliant on a single SKU's success; it can be sold as contract manufacturing independently.
4. **Licensing optionality.** A creator marketplace and brand-licensing program create high-margin recurring revenue once the production stack is built.
5. **Software compounding.** A design-to-production platform has operating-leverage and acquisition-target properties if it reaches enough users.

Five reasons an investor should be cautious

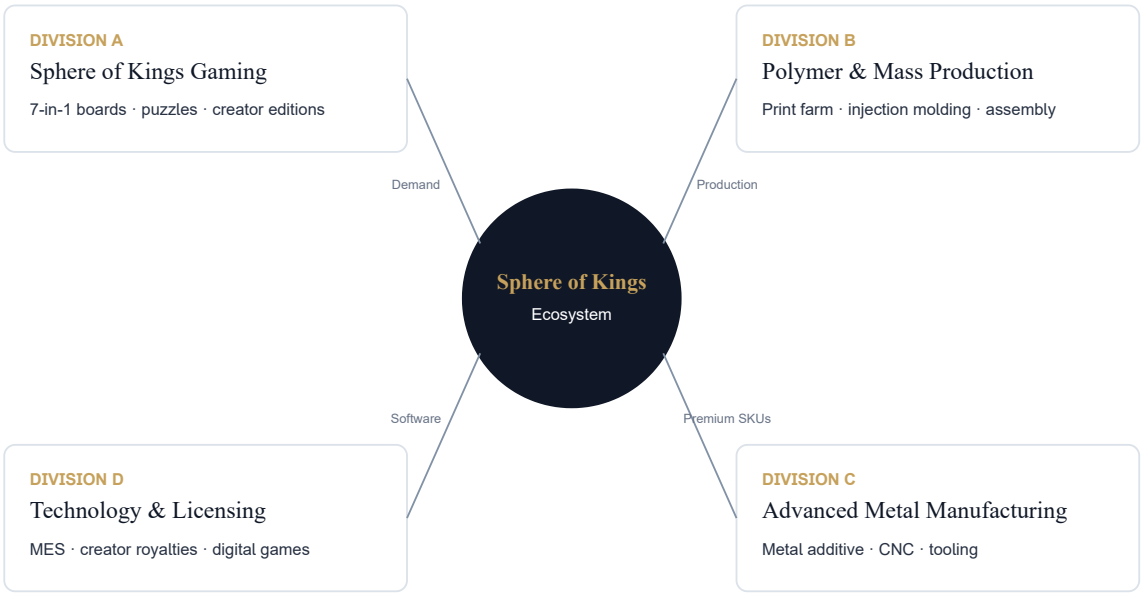

1. **Divisional complexity.** Running four distinct businesses from one holding company demands operating discipline that most seed-stage companies do not possess.
2. **Industrial-manufacturing lead times.** Building a qualified industrial customer pipeline typically takes years and does not respond to consumer marketing tactics.
3. **Metal additive capital intensity.** Equipment, materials, safety, qualification, and skilled operators are expensive; the division must be entered selectively.
4. **Facility and fixed-cost risk.** A premature 150,000 sq. ft. warehouse would consume capital before revenue justifies it.
5. **Founder concentration.** At this stage, delivery depends heavily on the founder; investor protection must include governance and a credible leadership-build plan.

The decisions investors are asked to make

- Participate at Stage 1 ($2M) under agreed milestones and governance.
- Reserve pro-rata rights on later stages, subject to performance.
- Approve an initial governance structure that grants investor-side board rights appropriate to the stage.
- Approve a documented capital-release schedule rather than a lump-sum commitment.

6 · Four-division ecosystem overview

The four divisions are designed to share customers, production capacity, software, and brand. The ecosystem diagram below shows how revenue, demand, and capability flow between them. Each division is described in full in Part II.

How the divisions reinforce each other

- **Gaming → Manufacturing:** Sphere of Kings orders provide the initial production commitment that justifies equipment purchases.
- **Manufacturing → Gaming:** In-house capacity gives SOK control over cost, quality, customization, and lead time; outside contract revenue absorbs overhead that would otherwise burden gaming unit cost.
- **Gaming + Metal → Collector market:** Premium metal editions are a high-margin brand extension that uses the metal division's capacity.
- **Licensing → Both:** Authorized creator designs run through the same production stack and generate royalty revenue with minimal marginal fixed cost.
- **Technology → All:** A shared design-to-production platform is the only scalable way to coordinate consumer and industrial demand against the same equipment.

PART II

Business divisions

Four divisions, evaluated on their own terms. Each is examined for what exists today, what the capital would fund, and the specific commercial evidence investors should expect to see in diligence.

7 · Division A — Sphere of Kings Gaming

Product architecture

Sphere of Kings is a spherical, modular game board that supports seven product experiences from a single hardware system:

#	EXPERIENCE	FORMAT	REPO ASSET
1	Royal Checkers	Spherical strategy — competitive play	`royal-checkers.png`
2	Imperial Kings	Spherical strategy — competitive play	`imperial-kings.png`
3	Pre-designed Puzzle	Themed collectible puzzles (Earth, Galaxy, Lion, Moon, Ocean)	`puzzle-*.jpg`
4	Custom Upload Puzzle	Customer-supplied artwork printed to puzzle pieces	`custom-upload-puzzle.webp`
5	DIY Paint Puzzle	Blank pieces for painting at home	`diy-puzzle-pieces.jpg`
6	Paintable Royal Checkers	Blank Royal Checkers pieces for customization	`royal-checkers-diy.jpg`
7	Paintable Imperial Kings	Blank Imperial Kings pieces for customization	`imperial-kings-diy.jpg`

Product tiers and proposed pricing

> MANAGEMENT-PROVIDED Pricing figures below are pre-launch targets. They will be validated against the Kickstarter cohort's response and against wholesale/retail-channel economics. Final pricing is subject to COGS validation and channel-strategy review.

TIER	TARGET RETAIL	SCOPE
Complete 7-in-1	$179	Full product with all seven experiences
Board only	$129	Sphere hardware, no puzzle/piece sets
Expansion packs	$12 – $79	Pack configurations (×3, ×5, ×10, ×20, ×50)
Creator Edition	tbc	Licensed-design collectible from the creator marketplace

Unit economics (illustrative)

> ILLUSTRATIVE At a current internal direct-manufacturing cost target of **~$30** per complete 7-in-1 set (bill of materials unvalidated), the gross contribution per set at a $179 retail price before channel fees is

approximately $149. Target gross margin is therefore the dominant lever in the gaming P&L. These figures require a validated BOM and cycle-time study before they can be treated as the base case.

Y5 ambition: the volume problem

At a blended average selling price of $130 (after channel discount, returns, and bundling), the gaming division would need approximately **769,000 complete-set-equivalent units** per year to reach the $100M gaming revenue target. That is substantially more demanding than selling 100,000 premium boards at $179.

> **REQUIRES CONFIRMATION** Investors should expect a bottom-up volume model that reconciles DTC / wholesale / retail / international / creator-edition / expansion-pack revenue to the $100M figure. The current Blueprint presents an ambition, not a channel-level build.

Launch and marketing

- **Kickstarter launch:** November 19, 2026 (verified in repository metadata).
- **Official Kickstarter funding goal:** $10,000 — conservatively set to protect the campaign's success-rate signal.
- **Founder aspirational campaign figure:** $30M. Treated here as aspirational only; not a forecast.
- **Marketing partner (Jellop):** Reported but *not yet documented in the data room*. Contract to be added before external circulation.

Channel and distribution plan

1. **Kickstarter cohort (2026-Q4 / 2027-Q1).** Pre-order fulfillment through the Kickstarter audience and the backer-notified prelaunch list.
2. **Direct-to-consumer.** Sphereofkings.com, re-enabled after Kickstarter fulfillment; currently in "Kickstarter-only mode" per commit `7679016`.
3. **Specialty retail.** Independent toy, puzzle, and hobby retailers after SOK validates product quality and wholesale economics.
4. **National retail.** Approached once production capacity and demand justify the SKU-count discipline retailers require.
5. **Creator editions & licensing.** Monetize approved creator designs through the marketplace in Division D.
6. **International.** Country-by-country review of demand, product-safety compliance, and landed cost.

Digital companion layer

The existing repository includes a playable 3D sphere game (commit `7871689`) with online multiplayer, phone-app shell, spectator mode, promotion, resign, clock, and chat. The product roadmap contemplates using the digital companion to extend engagement between physical game sessions and to acquire players who may later purchase physical products.

Key risks for this division

RISK	MITIGATION UNDER CONSIDERATION
Insufficient Kickstarter demand	Scale consumer business conservatively; defer unsupported expansion spending; retain polymer printing for flex capacity
Defect rate higher than expected	In-line inspection, lot traceability, defect-root-cause analysis, customer-communication playbook
Channel margin compression at retail scale	Preserve DTC mix; introduce creator editions and premium metal editions to lift blended margin
IP challenge on the spherical design	Patent clearance and filing program (Division D)
Product-safety / age-grading claims	Toy-safety testing prior to launch; children's-edition path requires additional compliance

Five-year revenue ambition for Division A

YEAR	Y1	Y2	Y3	Y4	Y5
Division A revenue (illustrative, USD M)	1.5	9	25	55	100

> ILLUSTRATIVE All divisional revenue figures throughout this document are management-provided illustrative targets. They are not independently validated forecasts.

Evidence investors should expect to see (Division A)

- Bill of materials, cycle time, and scrap data for the complete 7-in-1 set.
- Current prelaunch sign-up count and engagement metrics.
- Jellop engagement letter and campaign plan.
- Three-case Kickstarter cohort model (base / downside / upside) feeding into the Y1 revenue line.
- Retail buyer meeting log and any wholesale pricing commitments.

8 · Division B — Polymer Manufacturing & Mass Production

What this division does

Industrial polymer 3D printing, prototyping, injection molding, assembly, finishing, packaging, and contract production for outside customers. In the initial stages it is SOK's captive production capacity; in later stages it is a stand-alone contract manufacturing service.

What exists today

> MANAGEMENT-PROVIDED The founder has indicated access to Bambu Lab printers for small-batch production. No warehouse-scale polymer farm is in operation as of the date of this document. Equipment procurement, facility fit-out, and process qualification are part of Stages 1–3.

What Stages 1–3 build

1. **Stage 1 (part of $2M).** Validate print economics on the existing printer fleet; establish per-SKU cycle times, scrap rates, and material costs; produce the first Kickstarter cohort.
2. **Stage 2 (part of $8M).** Right-sized industrial polymer farm: Bambu Lab fleet expansion, multicolor printing, drying and material handling, finishing and inspection stations. Not a 150,000 sq. ft. facility — a right-sized pilot.
3. **Stage 3 (part of $20M).** Injection molding for the highest-volume SKUs after unit-volume thresholds are proven; CNC machining for precision components; packaging automation.

Process selection discipline

PROCESS	BEST SUITED TO	INVESTMENT CONSIDERATION
FDM polymer printing	Prototypes, customization, small batches	Flexible, relatively accessible equipment
Industrial polymer (SLS/MJF class)	Functional parts and repeatable batches	Higher equipment and process costs
Injection molding	Large volumes of standardized plastic parts	High upfront tooling; low potential unit cost
CNC machining	Precision metal and plastic parts	Material waste, tooling, setup, machine time
Casting & fabrication	Selected metal shapes and structures	Tooling, finishing, process-dependent economics
Outsourced manufacturing	Overflow orders and specialized capabilities	Lower capital commitment; reduced direct control

Make-or-buy worked example: flagship 7-in-1 game board

ILLUSTRATIVE Suppose the 3D-printed board component costs $30 in direct manufacturing (polymer, machine time, finishing, labor). Suppose the injection-molded equivalent costs $12 per unit but requires $180,000 of tooling. The per-unit saving is $18. Break-even units = **$180,000 ÷ $18 = 10,000 units** (ignoring financing, storage, design changes, scrap differences, and tool maintenance). Under these hypothetical assumptions, injection molding is less expensive after ~10,000 accepted units. *This illustrates why the business retains flexible 3D printing for customization while moving proven, high-volume products to more economical mass-production methods.*

Quality management

The manufacturing operation is intended to implement documented procedures covering incoming-material inspection, first-article approval, machine calibration, process validation, in-process inspection, final inspection, traceability, corrective action, and customer complaints. ISO 9001 certification is a target for general manufacturing; specialized industries will require additional qualifications. **No certification is claimed as held today.**

Contract-manufacturing commercial model

- **Target customer segments:** consumer-goods product companies needing low-volume runs or customization, industrial prototype shops, educational and R&D organizations, replacement-parts programs, and (later) qualified industrial accounts.
- **Pricing:** machine time + material + labor + post-processing + rejects + depreciation + overhead + required margin. Target gross margin will differ by SKU type and customer.
- **Commercial intake:** the Division D platform provides the automated quoting workflow needed to make contract-manufacturing commercially efficient.

Five-year revenue ambition for Division B

YEAR	Y1	Y2	Y3	Y4	Y5
Division B revenue (illustrative, USD M)	0.4	4	18	42	80

Customer mix implied by the Year-5 target

> ILLUSTRATIVE An $80M polymer/mass-production target combined with $50M of metal revenue (Division C) implies a combined industrial customer base of approximately:

CUSTOMER TYPE	ACTIVE CUSTOMERS	AVG. ANNUAL REVENUE	TOTAL
Large industrial accounts	20	$2.5M	$50M
Mid-market manufacturing clients	100	$500K	$50M
Small commercial accounts	300	$100K	$30M
Total	**420**		**$130M**

This is a sales-model mathematical breakdown, not a claim that these customers exist today. It implies a substantial business-development organization, technical quoting capability, quality system, and repeat-order pipeline.

Key risks for Division B

- Underutilization of equipment — fixed depreciation without contract backlog.
- Qualification overhead — each industrial account requires technical validation and documentation.
- Labor availability — skilled operators are in short supply in most U.S. regions.

- Material-cost volatility — polymer feedstock price swings can compress margin without a hedging program.

9 · Division C — Advanced Metal Manufacturing

What this division does

Metal additive manufacturing (laser powder-bed fusion class), CNC machining, tooling, industrial prototyping, and qualified specialized metal components. In the integrated ecosystem it also produces premium metal editions of Sphere of Kings game pieces and collectibles.

What exists today

> **STATUS** **No metal additive equipment has been ordered.** No qualified industrial customer agreements exist. No hazard assessment has been performed on any candidate facility for metal-powder operations. This division is entirely prospective as of the date of this Blueprint.

Why metal is in the plan at all

1. **Premium brand extension.** Metal pieces, tokens, and collector editions command premium pricing and reinforce the SOK brand.
2. **Industrial margin.** Qualified metal additive services sell at substantially higher margins than polymer printing.
3. **Facility and overhead absorption.** Once the polymer side is operating, an adjacent metal cell can share facilities, finance, HR, and software overhead.

Why metal must be entered selectively

- Equipment cost per LPBF system is typically in the seven figures installed.
- Metal powders have serious hazard profiles — combustible dust, inert atmospheres, dedicated rooms, dedicated HVAC, explosion protection, trained personnel.
- Customer qualification (aerospace, medical, automotive) is expensive and multi-year.
- Underutilized LPBF capacity is a cash-flow drag the business cannot absorb in its first two years.

Phased entry (proposed)

PHASE	ACTION	CAPITAL GATE
Phase 0 (Stage 2)	Subcontract metal parts to qualified vendors; test customer demand; build pipeline	Minimal — commercial effort only
Phase 1 (Stage 3)	First owned LPBF cell after ≥1 qualified anchor customer; dedicated metal-powder room; hazard assessment and insurance in place	Up to $9M in the Stage-3 envelope
Phase 2 (Stage 4)	Second and third LPBF systems; CNC finishing; heat-treatment capacity	Up to $18M total across Stages 3–4
Phase 3 (Stage 5)	Additional cells only if trailing-six-month utilization ≥ pre-agreed floor	Driven by utilization evidence

Target markets (under evaluation)

- **Industrial tooling and fixtures.** The most accessible first market.
- **Aerospace tier-2/3 parts.** High-value but demanding qualification process.
- **Medical devices.** Regulated applications; significant additional controls.
- **Automotive specialty.** Prototypes and low-volume production.
- **Consumer collectibles.** Premium SOK metal editions and licensed collectibles.

Capital envelope for Division C

LINE ITEM	ILLUSTRATIVE BUDGET
Metal additive manufacturing systems	$9.0M
Specialized metal printing accessories	$1.0M
Powder handling and recovery	$1.5M
Inert gas and industrial safety systems	$1.0M
Heat treatment and stress relief	$1.2M
Metal finishing and surface preparation	$1.0M
Metal testing and inspection equipment	$1.3M
Installation, qualification and commissioning	$2.0M
Total Division C allocation	**$18.0M**

This is an envelope, not an approved procurement schedule. Capital is intended to be released only after commercial evidence supports each phase.

Five-year revenue ambition for Division C

YEAR	Y1	Y2	Y3	Y4	Y5
Division C revenue (illustrative, USD M)	0	0	8	25	50

Modeled with zero revenue in Years 1–2 while the business tests demand through subcontracted production and completes hazard assessment, insurance, and customer qualification for an owned cell.

Key risks for Division C

RISK	MITIGATION
LPBF equipment underutilization	Subcontract-first phase; owned equipment only after anchor-customer evidence
Powder hazard incident	Dedicated room; combustible-dust program; hazard-assessment letter; insurance; trained operators; written emergency procedures
Customer qualification time & cost	Target less-regulated industrial markets first (tooling, fixtures) before aerospace/medical
Skilled-labor shortage	Training program; partnerships with trade schools; competitive compensation; dedicated metal-manufacturing director
Insurance refusal	Early engagement with specialty insurers; site-selection criterion for underwriter acceptability

Metal division go / no-go gate

> **GOVERNANCE PROPOSAL** Stage-3 release of metal-related capital should be conditioned on: (i) ≥1 signed anchor customer with a dollar-value threshold; (ii) completed hazard assessment and insurance in-principle; (iii) metal-manufacturing director hired and in post; (iv) secondary vendor options identified. Absent any of these, the metal allocation is redirected to Divisions B and D.

10 · Division D — Technology, Licensing & Digital Platforms

What this division does

Software and intellectual property. The technology stack that coordinates design intake, quoting, scheduling, inventory, quality, royalties, and customer communication across Divisions A, B, and C. The licensing framework that monetizes approved creator designs, brand licensing, and intellectual property. The digital companion game and associated digital products.

Platform architecture (proposed)

LAYER	FUNCTION	STATUS
Customer portal	Quote intake, order status, file uploads, approvals	PROPOSED
AI-assisted quoting	Price estimation from CAD geometry, with rules review	PROPOSED
Manufacturing execution	Job routing, machine status, operator instructions	PROPOSED
Quality & traceability	Lot/machine/material records; defect analysis	PROPOSED
Creator royalties	Design submission, approval workflow, royalty accounting	PROPOSED
Digital companion	Online 3D sphere, multiplayer, tournaments	SHIPPED (3D SPHERE, MULTIPLAYER, PWA)
Commerce (DTC)	Storefront, carts, Stripe, wholesale checkout	SHIPPED; CURRENTLY IN KICKSTARTER-ONLY MODE

Creator marketplace

A proposed platform where approved creators submit designs for manufacture, licensing, and sale. The reference economic model is a **50/50 split of contractually defined net profit** for eligible creator products, where "net profit" is explicitly defined in the contract to include the following eligible deductions:

- Direct manufacturing cost (materials, machine time, labor).
- Packaging and fulfillment.
- Marketing and advertising attributable to the product.
- Platform fee (payment processing, customer support).
- Third-party royalties (where the creator has licensed-in rights).
- Returns and allowances.

Rights ownership, exclusivity, territory, and term are contract-by-contract. The marketplace does *not* acquire creator intellectual property by default.

Brand and franchise licensing (long-term)

Separately, the Company intends to pursue brand licensing agreements with entertainment, sports, and consumer brands for themed Sphere of Kings editions. These are negotiated individually and are **not** included in the illustrative Year-5 licensing revenue of $20M without specific contractual commitments.

Intellectual property program (proposed)

- Utility patents for qualifying technical inventions (e.g. spherical seam mechanism, modular lock).
- Design patents for eligible ornamental designs.
- Trademark registration for "Sphere of Kings" and related marks.
- Copyright registration for original artwork and software.
- Trade-secret program for internal manufacturing methods and parameters.

Five-year revenue ambition for Division D

YEAR	Y1	Y2	Y3	Y4	Y5
Division D revenue (illustrative, USD M)	0.1	2	4	8	20

Why this division is capital-efficient

- Licensing revenue, once the platform is built, scales with limited marginal fixed cost.
- Software reduces administrative overhead across every other division, which lowers the break-even unit volume for the entire enterprise.
- The digital companion game extends the SOK brand into always-on engagement between physical game sessions.

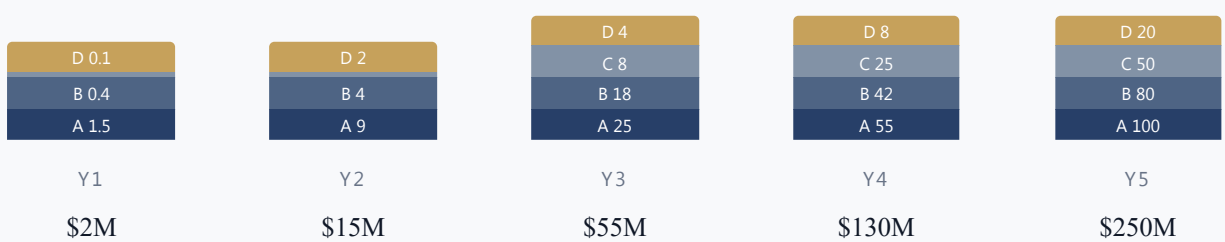

Why this division is riskier than it looks

- Building a reliable manufacturing execution system is a specialized engineering effort, not a generic SaaS build.
- Creator marketplaces are hard to seed without brand gravity; chicken-and-egg dynamics apply.
- Software talent is expensive in the geographies where the Company is likely to operate.
- AI-assisted quoting is useful but requires validated pricing rules and engineering review before any customer-facing deployment.

Evidence investors should expect to see (Division D)

- Software scope document, technical architecture, and build-vs-buy analysis per layer.
- IP assignment agreements from every past contractor.
- Patent-landscape / freedom-to-operate memo.
- Trademark clearance letter.
- Draft creator-marketplace terms and example royalty statement.
- Draft brand-licensing term sheet for prospective partners.

Combined Y5 revenue ambition across all four divisions

Illustrative divisional revenue stack, USD millions. Dark navy: Division A (Gaming). Mid: B (Polymer & mass production). Light steel: C (Metal). Gold: D (Technology & licensing). Not a forecast.

PART III

Development & expansion strategy

How the plan is built, in order: the five-year roadmap, the facility, the equipment, the make-or-buy discipline, and the organization needed to operate it.

11 · Five-year strategic roadmap

YEAR	PRIMARY OBJECTIVE	DEVELOPMENT MILESTONES	CAPITAL STAGE
Y1 · Validate	Prove product economics; fulfill Kickstarter; institutional-grade accounts	BOM & cycle-time validated · 1st manufacturing cohort shipped · audited opening balance sheet	Stage 1 ($2M)
Y2 · Launch	Right-sized warehouse operation; first industrial pilot customer; DTC reopened	Lease executed · polymer pilot at ≥60% utilization · 1 industrial pilot · retail wholesale launch	Stage 2 ($8M)
Y3 · Industrialize	Mass-production capacity; metal pilot operating; creator marketplace live	Injection tooling validated · first qualified metal part · marketplace launched · 1st licensed brand	Stage 3 ($20M)
Y4 · Scale regionally	Contract manufacturing at scale; second site if demand supports	420-customer pipeline built · Y4 revenue above floor · second site business case approved	Stage 4 ($30M)
Y5 · Scale globally	Diversified gaming + manufacturing operation; selective international markets	Trailing-twelve-month revenue above floor · 2 international markets validated · audited financials	Stage 5 ($40M)

Dependencies and critical path

1. **Kickstarter fulfillment discipline** sets the credibility foundation for every subsequent stage.
2. **Equipment quotations for Stage 2** must exist before Stage-1 capital is deployed, so that scaling is not blocked by vendor lead times.
3. **First industrial pilot customer** must be identified during Stage 1 and signed during Stage 2 — not deferred.
4. **Hazard assessment** for any eventual metal operation must be commissioned during Stage 2, so that Stage 3 metal spend is not delayed.
5. **Independent audit** after Year 1 is essential to Stage 2 and beyond.

12 · Warehouse & facility master plan

An illustrative — not committed — 150,000 sq. ft. design case

> **STATUS** No lease has been signed. A 150,000 sq. ft. facility is used here as an illustrative design case only. The Company recommends an initial smaller pilot facility and only moves to a flagship scale once contract backlog and production economics justify it.

Representative space allocation (illustrative)

AREA	APPROX. SQ. FT.	NOTES
Polymer 3D-print farm	30,000	Rows of printer cells, drying rooms, operator stations
Metal additive cell (isolated)	8,000	Dedicated powder room, inert atmosphere, hazard separation
Injection molding	15,000	Machines, tooling store, ancillary chillers
CNC machining	8,000	Machining centers, tool cribs, coolant management
Finishing & assembly	15,000	Post-processing, paint, dry-time, assembly lines
Inspection & metrology	4,000	Dimensional inspection, materials lab, documentation
Warehouse: raw & WIP	15,000	Racking, moisture-controlled areas
Warehouse: finished goods & shipping	20,000	Fulfillment, packaging, loading docks
Engineering & office	15,000	Design, engineering, admin, meeting, demo
Circulation, utilities, future expansion	20,000	Corridors, electrical, HVAC, mechanical, break rooms
Total (illustrative)	**150,000**	

Critical engineering requirements

- **Three-phase electrical service** sized for connected machine loads with headroom for expansion.
- **Industrial HVAC and process-specific ventilation** (polymer emissions, metal powder, post-processing fumes).
- **Fire suppression and combustible-dust protection** appropriate to each process.
- **Compressed air, chilled water, inert-gas** distribution for the applicable processes.
- **Loading docks, internal logistics, and racking** sized to throughput.

Site-selection criteria

Site selection must compare: total occupancy cost (lease + improvements), electrical capacity and utility lead times, zoning and permitted industrial activities, fire and environmental approval pathways, skilled-labor availability and prevailing compensation, distance to suppliers and freight hubs, local incentives and tax regime, and expansion capacity. The Company intends to shortlist three candidate sites and run a documented comparison before committing to any lease.

13 · Equipment procurement strategy

Guiding principles

1. **Buy against evidence.** Each equipment class is to be purchased only after demand evidence justifies its full lifecycle cost.
2. **Stage the fleet.** Avoid large single-vendor purchases; stage orders to incorporate operating lessons.
3. **Preserve optionality.** Where sub-contracting can substitute for an owned machine class in the first phase, start that way.
4. **Insist on quotations.** No equipment-class capital is released without three competitive quotations on file.

Representative equipment classes and budget envelope

CLASS	EXAMPLE USE	ILLUSTRATIVE BUDGET
Bambu Lab printer fleet	Polymer SOK board production; small-batch contracts	$5.0M
Backup & replacement polymer printers	Capacity continuity	$1.0M
Multicolor printing equipment	Creator-edition and premium SKUs	$1.0M
Industrial polymer (SLS/MJF class)	Functional contract parts	$1.0M
Finishing & post-processing	Cleaning, curing, sanding, paint	$1.2M
Metrology & inspection	Dimensional inspection, materials test	$0.8M
Spare parts & maintenance tools	Reliability program	$0.7M
Metal additive systems (LPBF class)	High-value industrial parts, premium SKUs	$9.0M
Heat treatment & finishing	Stress relief, surface preparation	$2.2M
Injection molding + tooling	High-volume SKUs after validation	$6.0M
CNC machining + workholding	Precision metal and plastic	$3.5M
Robotics & automation	Machine tending and assembly	$2.0M

Equipment payback discipline

> ILLUSTRATIVE Consider a hypothetical $5,000,000 automated production line that generates $1,500,000 of incremental annual operating cash flow after incremental operating costs and taxes. The simple payback is **$5,000,000 ÷ $1,500,000 ≈ 3.3 years**. Any specific machine purchase is evaluated using discounted cash flow, residual value, maintenance capex, utilization risk, and taxes. This is a decision rule, not a forecast for a specific machine.

Vendor selection

Equipment procurement will be governed by (i) a formal RFQ to three or more vendors for each class, (ii) reference checks on at least two existing users per vendor, (iii) lifecycle total-cost analysis including maintenance, parts, and expected uptime, and (iv) commissioning-and-qualification milestones built into payment terms.

14 · Manufacturing process selection and make-or-buy

A major component of the investment strategy is choosing the most economical manufacturing method for each SKU rather than assuming every part should be 3D printed. The following decision framework is applied to every SKU.

Decision tree (summary)

1. **Can we subcontract this at acceptable landed cost and quality?** If yes, subcontract until internal demand justifies equipment.
2. **Is annual accepted volume < the break-even against tooling?** If yes, retain additive / small-batch methods.
3. **Does the part have precision or finish requirements beyond additive capability?** Add CNC or finishing steps.
4. **Is annual accepted volume > break-even AND SKU design stable for >24 months?** Invest in tooling for injection molding.
5. **Is the part high-value and amenable to additive?** Evaluate metal additive against subcontracted CNC.

Capacity model requirements

Each equipment class is to be modeled on the following inputs before capital release: machine hours per shift, cycle time per part, scrap rate, operator hours per completed unit, material cost per unit, overhead allocation, target utilization at 1/2/3-shift operation, output per machine per day, and expected OEE. These inputs are the basis of the capacity model required in the Investor Readiness Checklist.

Quality management system

Documented procedures covering: incoming material inspection, first-article approval, machine calibration, process validation, in-process inspection, final inspection, lot/machine/material traceability, corrective action, customer complaints, and continuous improvement. ISO 9001 certification is a target for general manufacturing; aerospace, medical, or automotive customers will require additional specialized qualifications, which are **not** claimed to be in place today.

Supplier and material strategy

- At least two qualified suppliers for every critical material class.
- Documented acceptance criteria and incoming-inspection plans.
- Material traceability linked to work orders and finished-goods lots.
- Hazardous-material storage and handling per applicable regulations.
- Price-volatility exposure review quarterly; hedging considered where material becomes a dominant cost line.

15 · Organizational structure and staffing

Leadership team (proposed build)

ROLE	PRIORITY	HIRE STAGE
Founder / CEO (James Scott Bowser)	In post	—
Chief Financial Officer	Essential	Stage 1
Chief Operating Officer (industrial experience)	Essential	Stage 2
Chief Technology Officer	Essential	Stage 1–2
Manufacturing Engineering Director	Essential	Stage 2
Metal Manufacturing Director (qualified)	Gate for Stage 3	Stage 3
Quality Director	Essential	Stage 2
Head of Industrial Sales (B2B)	Essential	Stage 2
Head of Licensing & Creator Programs	Important	Stage 3
Head of Consumer Marketing / Community	Essential	Stage 1
Head of People / HR	Essential	Stage 2
General Counsel (or outside counsel of record)	Essential	Stage 1

Headcount envelope (indicative)

FUNCTION	Y1	Y2	Y3	Y4	Y5
Executive & admin	3	6	10	14	18
Engineering & product	4	10	18	26	34
Manufacturing operators	4	18	48	90	140
Quality & safety	1	4	10	18	26
Software & automation	2	6	12	18	24
Sales & business development	2	6	14	22	30
Customer & community support	2	6	12	20	30
Total headcount (indicative)	**18**	**56**	**124**	**208**	**302**

Indicative only. The actual plan is driven by the capacity and revenue models and will be recalibrated with each stage's planning cycle.

Governance and board

- Appropriately-constituted board, including at least one independent director by Stage 2.
- Investor board rights per negotiated term sheet; protective provisions on key matters.
- Audit, compensation, and (later) risk committees as the company matures.
- Capital-expenditure authorization matrix tied to investor approvals.

PART IV

The $100M capital strategy

How the capital is proposed to be staged, deployed, and evaluated. 70 budget line items, five funding tranches, and the illustrative financial scenarios the figures imply.

16 · Five-stage funding strategy

STAGE 1	STAGE 2	STAGE 3	STAGE 4	STAGE 5
$2M	$8M	$20M	$30M	$40M
Validation	Commercial launch	Industrial expansion	Regional scaling	Global expansion

Stage 1 — Validation ($2M)

Prove product economics and production reliability. Deliverables: validated BOM and cycle time; audited opening balance sheet; first Kickstarter cohort fulfilled; three warehouse-site candidates evaluated; CFO, CTO, Head of Marketing, and legal counsel engaged; initial industrial-pilot customer identified. Stage 1 is intended to be the evidence base that justifies Stage 2.

Stage 2 — Commercial launch ($8M)

Establish right-sized warehouse manufacturing. Deliverables: lease executed on the preferred site; polymer pilot operating at ≥60% target utilization for 90 days; first industrial pilot customer signed; DTC commerce reopened; audited Year-1 financial statements; Stage-3 equipment quotations on file.

Stage 3 — Industrial expansion ($20M)

Add high-volume equipment and qualified metal pilots. Deliverables: injection-molding tooling validated for the flagship SKU; first qualified metal part delivered to an anchor customer; creator marketplace launched; licensing agreements with at least one established brand; trailing-six-month gross margin above a pre-agreed floor.

Stage 4 — Regional scaling ($30M)

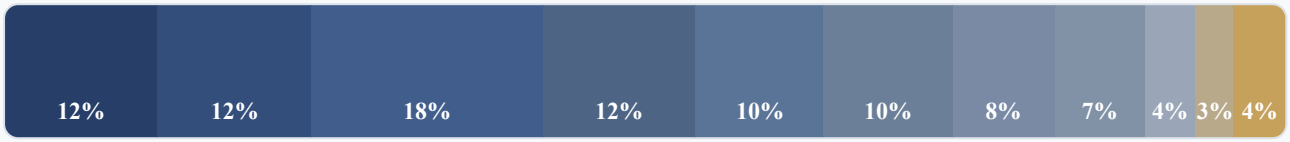

Expand contracted manufacturing capacity. Deliverables: 420-account industrial pipeline built (per the Division B/C sales model); secondary facility business case approved; Y4 revenue above pre-agreed floor; at least two region-specific customer validations.

Stage 5 — Global expansion ($40M)

Scale proven operations and selective international markets. Deliverables: trailing-twelve-month revenue above a pre-agreed floor; two validated international markets; audited financial statements supporting institutional reporting; exit-readiness review.

> **IMPORTANT** Each stage is proposed to be contractually conditioned on the prior stage's deliverables. Later stages are not a commitment to fund on a calendar. The Company explicitly recommends this structure to investors as a feature, not a constraint.

17 · Proposed use of funds

- Facilities & utilities — $12M
- Metal manufacturing — $18M
- Technology & automation — $10M
- Sales & marketing — $8M
- IP, legal & compliance — $4M
- Contingency — $4M
- Polymer manufacturing — $12M
- Mass production & CNC — $12M
- Materials & working capital — $10M
- Staffing & training — $7M
- Distribution — $3M

A. Industrial facilities — $12M

Industrial facility lease deposits and initial occupancy	$1.5M
Building modifications and production layouts	$2.0M
Electrical distribution and capacity upgrades	$2.0M
HVAC and industrial ventilation	$1.5M
Fire suppression and safety infrastructure	$1.0M
Compressed air and utility infrastructure	$0.8M
Loading docks and internal logistics	$0.7M
Racking and industrial storage	$0.8M
Engineering offices and IT rooms	$0.5M
Site planning, permitting and commissioning	$1.2M

B. Polymer 3D-print farm — $12M

Industrial-scale polymer printer fleet	$5.0M
Backup printers and replacement capacity	$1.0M
Multicolor printing equipment	$1.0M
Industrial polymer printing systems	$1.0M
Finishing, cleaning and post-processing	$1.2M
Inspection and dimensional metrology	$0.8M

Spare parts and maintenance tools	$0.7M
Printer commissioning and process validation	$0.6M
Material drying and handling equipment	$0.7M

C. Industrial metal manufacturing — $18M

Metal additive manufacturing systems	$9.0M
Specialized metal printing accessories	$1.0M
Powder handling and recovery	$1.5M
Inert gas and industrial safety systems	$1.0M
Heat treatment and stress relief	$1.2M
Metal finishing and surface preparation	$1.0M
Metal testing and inspection equipment	$1.3M
Installation, qualification and commissioning	$2.0M

D. Mass production and industrial machining — $12M

Injection molding machines	$3.0M
Production molds and tooling	$3.0M
CNC machining centers	$2.5M
CNC tooling and workholding	$1.0M
Assembly-line equipment	$1.0M
Packaging and labeling equipment	$1.0M
Material handling and production fixtures	$0.5M

E. Technology and automation — $10M

Manufacturing execution software	$2.0M
Customer portal and quoting system	$1.5M
AI-assisted production and quality systems	$1.5M
Robotics and machine tending	$2.0M
Enterprise resource planning	$1.0M
Cybersecurity and infrastructure	$0.7M
Digital gaming development	$0.8M
Creator licensing and royalty software	$0.5M

F. Materials and working capital — $10M

Polymer raw materials	$2.0M
Metal raw materials	$2.0M
Packaging and components	$1.0M
Work-in-process and finished-goods inventory	$1.5M
Customer receivables funding	$2.0M
Operating liquidity buffer	$1.5M

G. Sales and marketing — $8M · H. Workforce — $7M · I. IP, legal & compliance — $4M · J. Distribution — $3M · K. Contingency — $4M

The full line-item detail for allocations G–K is preserved in the *Source and Assumption Register* and in the investor data room. All eleven allocations together total $100M.

> **IMPORTANT** This is a **capital envelope**, not an approved procurement schedule. It does not assume every line will be spent. It also does not mean the business has five years of payroll and operating expenses fully covered: ongoing costs must be funded by customer receipts, working capital, and the detailed cash-flow plan — *not* from the capital envelope.

18 · Five-year revenue projections (illustrative)

DIVISION	Y1	Y2	Y3	Y4	Y5
A · Sphere of Kings Gaming	1.5	9	25	55	100
B · Polymer and mass production	0.4	4	18	42	80
C · Metal manufacturing	0	0	8	25	50
D · Licensing and digital	0.1	2	4	8	20
Total revenue (USD M)	**2.0**	**15**	**55**	**130**	**250**

Illustrative management targets. The metal division is modeled with zero revenue in Y1–Y2 while the business evaluates demand and completes qualification steps. These are not forecasts.

Gaming volume sensitivity (Y5)

BLENDED ASP	UNITS FOR $100M	COMMENT
$130	769,231	Base-case blended ASP across DTC/wholesale/retail/international
$160	625,000	If mix tilts to DTC and creator editions
$100	1,000,000	If wholesale/retail becomes the dominant channel
$80	1,250,000	Deep-discount / clearance scenario

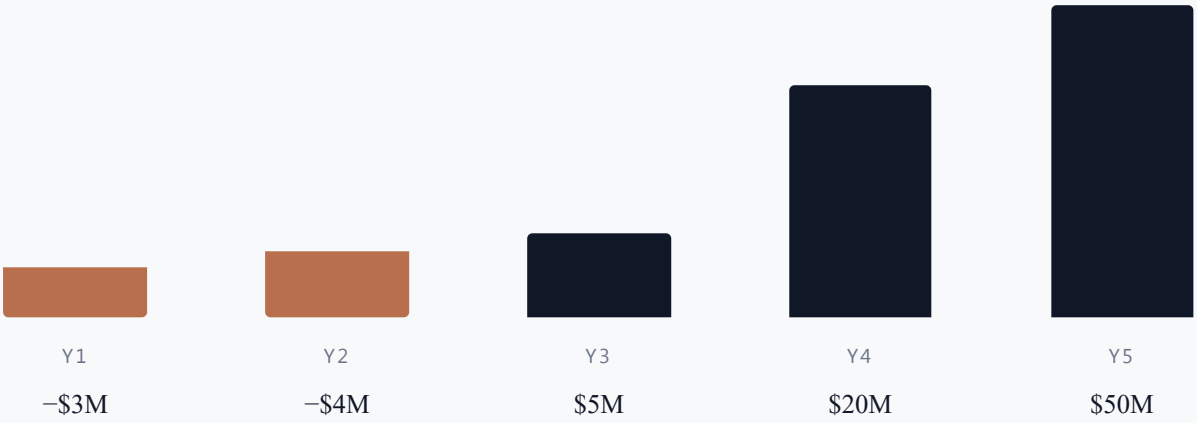

The table shows how sensitive the gaming-volume target is to blended ASP assumptions. The channel mix that supports $130 ASP is itself an item requiring validation.

Industrial customer mix (Y5, implied)

CUSTOMER TYPE	ACTIVE	AVG. REV.	TOTAL
Large industrial accounts	20	$2.5M	$50M
Mid-market manufacturing clients	100	$500K	$50M
Small commercial accounts	300	$100K	$30M
Total	**420**		**$130M**

19 · EBITDA, cash flow, and break-even

Illustrative annual EBITDA

USD millions. Illustrative management targets. Not audited earnings.

Illustrative Year-5 free cash flow bridge

LINE	USD M
EBITDA	50
Less: cash interest	(2)
Less: cash taxes	(7)
Less: maintenance capital expenditure	(8)
Less: additional working capital	(5)
Illustrative cash flow after these items	**28**

> ILLUSTRATIVE Excludes additional growth capex, acquisitions, and distributions. Actual cash flow could be materially lower or negative. A complete investor model must include income statements, balance sheets, cash-flow statements, financing schedules, and monthly liquidity forecasts.

Break-even considerations

Enterprise-level break-even is driven by (i) the fixed-cost base established by facility, headcount, equipment depreciation, and software, and (ii) the gross contribution margin from each revenue line. The contribution-margin mix across divisions is the central lever investors should test. Under the illustrative targets, operating break-even sits between Year 2 and Year 3.

Cash flow and working capital considerations

- Kickstarter cohort is cash-positive before production begins — a one-time working-capital benefit.
- Subsequent DTC cash flow is near-term; wholesale/retail extends receivables.

- Industrial contract manufacturing typically carries 30–60 day receivables; customer deposits may be required for custom tooling.
- Metal raw materials are expensive and must be managed carefully to avoid working-capital ballooning as Division C scales.
- The $10M materials-and-working-capital allocation in the use-of-funds is a *starting* envelope; ongoing working capital is funded from operations and short-term financing once the company is cash-generative.

Capital expenditure requirements

Growth capex is phased into Stages 2–5; maintenance capex is modeled at approximately $8M per year by Year 5 against the installed base. The Company's accounting policy will depreciate equipment on realistic useful lives (5–10 years, class-dependent), with impairment reviews aligned to stage milestones.

20 · Illustrative valuation and investor return scenarios

Valuation framework

> ILLUSTRATIVE Valuation references in this Blueprint use a hypothetical **$300M pre-money** for the full $100M program, producing a **$400M post-money** and a **25%** investor stake. This is a modeling convention, not an independent valuation and not an offer. Actual valuation will be determined by the Company, its counsel, and participating investors through a negotiated process.

Year-5 enterprise value sensitivity (EBITDA multiple method)

EBITDA MULTIPLE	EV AT $50M Y5 EBITDA
6×	$300M
8×	$400M
10×	$500M
12×	$600M
15×	$750M
20×	$1,000M

Multiples are sensitivity assumptions, not claims about current comparable-company market valuations. Actual multiples depend on growth, customer concentration, capital intensity, recurring-revenue mix, margin profile, and market conditions at exit.

Illustrative investor outcomes (25% stake, no dilution, no other adjustments)

EXIT EQUITY VALUE	INVESTOR PROCEEDS	TOTAL ROI	ANNUALIZED RETURN (5Y)
$100M	$25M	−75%	−24.2%
$250M	$62.5M	−37.5%	−9.0%
$400M	$100M	0%	0%
$500M	$125M	25%	4.6%
$750M	$187.5M	87.5%	13.4%
$1,000M	$250M	150%	20.1%
$1,500M	$375M	275%	30.3%
$2,000M	$500M	400%	38.0%

EXIT EQUITY VALUE	INVESTOR PROCEEDS	TOTAL ROI	ANNUALIZED RETURN (5Y)
$3,000M	$750M	650%	49.6%

Assumes no dilution, transaction costs, taxes, distributions, or preferred-share adjustments. These are mathematical sensitivities, not promises.

> **IMPORTANT** A profitable factory can still produce a disappointing equity return if investors purchase shares at an excessive valuation. The *valuation paid by investors* is as important as the Company's operating success. Both are subject to negotiation. The Company does not represent or guarantee any investor return.

Year-5 target

An ambitious but not unrealistic investor objective, **under the illustrative assumptions**, is a 20% or greater annualized equity return over five years. On a $100M invested for 25% ownership, that implies ~$249M of investor proceeds and ~$995M of exit equity value — before costs. This gives investors a measurable objective rather than a vague promise of substantial returns.

PART V

Governance, risk, exit

How the company is governed, how it manages its risks, and how investors may ultimately realize a return.

21 · Governance and investor protection

Proposed investment structure

The Company anticipates a multi-stage offering structured through convertible preferred shares, with negotiated protective provisions, board rights, and information rights appropriate to each stage. Final structure will be defined with counsel and in consultation with investors. The $100M envelope may also accommodate equipment debt where it reduces dilution without excessive fixed obligations.

Capitalization and ownership considerations

- Current capitalization table must be finalized and delivered to the data room prior to Stage 1.
- Stage-1 pre-money / post-money valuation to be determined by negotiation.
- Stage 2–5 pricing anticipated to follow stage-specific valuations; pro-rata rights will be considered for Stage-1 participants.
- An employee stock option pool will be sized to support the headcount build in Part III.

Board composition (proposed)

SEAT	STAGE
Founder	From day one
Investor seat (Stage 1)	Stage 1
Independent director (industry)	Stage 2
Second investor seat (Stage 3+)	Stage 3
Independent chair (optional, by Stage 4)	Stage 4

Protective provisions (illustrative; subject to negotiation)

- Investor approval for capital-expenditure commitments above a threshold.
- Investor approval for new debt beyond a threshold.
- Investor approval for M&A, dissolution, or change of control.
- Investor approval for changes to charter, share classes, dividend policy.
- Investor approval for any transaction with related parties.
- Information rights: audited annual financials, unaudited quarterly, monthly operating KPIs.

Capital-expenditure authorization matrix

DECISION VALUE	AUTHORITY
Up to $50K	CFO / COO under approved budget
$50K – $500K	CEO + CFO
$500K – $2.0M	Board approval

DECISION VALUE	AUTHORITY
Above $2.0M	Board + investor protective-provision approval

Investor reporting and accountability

The Company intends to deliver standardized monthly operating KPIs (revenue by division, gross margin, cash on hand, cash burn/generation, headcount, pipeline), quarterly unaudited financials, and annual audited financials by Stage 2. Independent audits will be arranged through a nationally recognized accounting firm acceptable to lead investors.

22 · Risk register and mitigation

RISK	LIKELIHOOD	IMPACT	MITIGATION
Kickstarter cohort underperforms	Medium	High (Y1 revenue)	Conservative official goal; defer unsupported expansion; retain polymer flex capacity
Flagship product defect rate exceeds target	Medium	High	Lot/machine/material traceability; in-line inspection; customer-communication playbook; service & replacement reserve
Metal additive demand insufficient at Y3	Medium-High	High (Y3+ capex)	Subcontract-first phase; owned equipment only after signed anchor customer; metal go/no-go gate
Major industrial customer cancels	Medium	Medium	Customer concentration limits; diversified pipeline; customer-deposit requirements for custom tooling
Raw-material price shock	Medium	Medium	Dual-source every critical input; quarterly review; hedging for dominant cost lines
Equipment underutilization	Medium	High	Staged purchases; pricing & sales-pipeline review before each buy; secondary-market exit path
Critical machine failure	Low-Medium	Medium	Preventative maintenance; backup capacity; qualified subcontractor partners; parts stock
Cybersecurity incident (customer files, IP)	Medium	High	Access reviews; vulnerability assessments; backups; monitoring; incident-response plan; breach-notification compliance
IP challenge	Low-Medium	High	Freedom-to-operate memo before filings; patent clearance; product-design alternates; appropriate insurance
Toy-safety or regulatory finding	Low	High (recall)	Toy-safety testing pre-launch; children's editions subject to additional compliance; reserve for recall insurance
Metal-powder hazard incident	Low	Severe	Hazard assessment; dedicated room; combustible-dust program; insurance; trained operators; emergency procedures
Founder key-person dependency	High (early)	High	Build the leadership team per Part III; key-person life/disability insurance; documented operating processes
Later-stage capital not available	Medium	High	Milestone-gated structure permits pause; discipline on fixed-cost base; relationships with secondary investor sources
Overbuilding facility too early	Medium	High	Right-sized Stage-2 facility; 150K sq. ft. is *illustrative only*; secondary site considered on documented business case

This risk register is not exhaustive. Investors should expect to see a more detailed enterprise-risk register, insurance-coverage summary, and incident-response plan in the data room.

23 · Exit and liquidity considerations

The Company does not promise a specific exit timing or structure. The following pathways are provided as the ways in which investor liquidity may be realized, each of which depends on performance, market conditions, and investor preference at the relevant time.

Pathway A — Strategic sale

Acquisition by a larger consumer-products company (interested in the gaming division and licensing platform), or by a larger industrial manufacturing group (interested in the production capacity, metal additive capability, and software stack), or by a strategic combination. Strategic acquirers may pay a premium for brand, IP, and customer relationships.

Pathway B — Financial sponsor sale

Acquisition by a private-equity firm after the Company reaches scale and recurring cash flow. Financial sponsors typically value EBITDA multiples and may support an additional phase of growth before a subsequent exit.

Pathway C — Dividend recap / partial liquidity

At a later stage of cash generation, a partial liquidity event via debt-financed distribution or secondary share purchase may be considered. This path requires a stable operating profile and strong lender appetite.

Pathway D — Public market

A public offering is possible at scale but is not the primary planning assumption. It would require audited financials, independent governance, Sarbanes-Oxley readiness, and market conditions supportive of a mid-cap industrial listing.

Exit-readiness build

- Audited financial statements from Year 2 onward.
- Documented management processes and operating playbooks.
- Clean cap table, IP ownership, and contracts.
- Diversified customer base with no single customer > a pre-agreed concentration limit.
- Quality system certification (ISO 9001 and any customer-specific qualifications earned).
- Three-year track record of hitting plan.

Investor rights on exit

- Liquidation preference on preferred shares (terms to be negotiated).
- Drag-along and tag-along rights.
- Pre-emptive rights on new issuances.
- Rights of first refusal on transfers.
- Information rights continuing until exit.

PART VI

Due diligence & submission

What the Company has today, what it must still produce before external submission, and the proposed next steps for investor engagement.

24 · Investment readiness overview

AREA	STATUS	COMMENT
Investor Master Blueprint	V1.0 DRAFTED	This document
Source & Assumption Register	V1.0 DRAFTED	Companion document
Investor Readiness Checklist	V1.0 DRAFTED	Companion document
Executive summary	V1.0 DRAFTED	Companion document
Pitch deck outline	V1.0 DRAFTED	Pitch deck itself to be built
Integrated five-year financial model	TO BUILD	Bottom-up model required
Equipment procurement schedule	TO BUILD	Three quotations per class
Warehouse feasibility study	TO BUILD	Three-site comparison
Commercial sales & customer pipeline	TO BUILD	Signed LOIs preferred
Manufacturing capacity model	TO BUILD	Per-SKU cycle / yield data
Legal & IP package	TO BUILD	Cap table, IP assignments, FTO memo
Audited financial statements	Y2 TARGET	Opening balance sheet at Stage 1
Rabbit Capital / Shark Ready documentation	AWAITING	Engagement letter & any correspondence
Jellop engagement letter	AWAITING	Required before external circulation
Toy-safety test reports	TO BUILD	Required for product launch
Insurance (product liability, cyber, premises)	TO BUILD	Policies to data room

Data room structure (proposed)

A single investor data room with the following top-level folders: 01 Corporate, 02 Financials, 03 Business plan & this Blueprint, 04 Product & IP, 05 Operations & equipment, 06 Facility, 07 Commercial & pipeline, 08 Legal & compliance, 09 Insurance, 10 Technology, 11 References & introductions. Access is controlled per NDA; each folder has an index and a "change log" file identifying additions since each investor's last visit.

25 · Outstanding information & verification register

The following items are the highest-priority outstanding items identified during preparation of this Blueprint. Each should be resolved by the responsible party before the Blueprint is circulated externally. The full detail is maintained in the companion *Source and Assumption Register*.

ITEM	WHY REQUIRED	STATUS	RESPONSIBLE
Rabbit Capital / Shark Ready documentary trail	Any Blueprint claim implying committed funding must be substantiated or removed	Awaiting documents	Founder + counsel
Current capitalization table	Investors require this in the first 10 minutes of diligence	Awaiting	Founder + CFO
IP ownership confirmation (brand, designs, software)	Ambiguity on IP ownership is fatal to institutional financing	Awaiting	Founder + IP counsel
Bottom-up financial model	Replaces top-down divisional ambitions with evidence-based build	To build	CFO + external support
Stage-1 & Stage-2 equipment quotations	Supports the first $10M of capital deployment	To build	Operations lead
Smaller pilot-facility feasibility study	Replaces illustrative 150K sq. ft. with a defensible first-site plan	To build	Operations lead + broker
Signed industrial pilot customer LOI	Gate for Stage 2 → Stage 3 industrial investment	Prospecting	Head of Industrial Sales (to be hired)
Jellop engagement letter & campaign plan	Supports Division A launch strategy	Awaiting	Founder
Freedom-to-operate memo on spherical game system	Reduces IP-challenge risk before scale-up	To commission	IP counsel
Three-site shortlist for Stage-2 facility	Documented comparison replaces assumed location	To build	Operations lead

Proposed next steps for investor engagement

1. **Resolve all A-list items** in the Source and Assumption Register before external submission.
2. **Clear six blockers** in the Investor Readiness Checklist (Shark Ready/Rabbit documentation, cap table, IP confirmation, financial model, Stage-1/2 quotations, pilot facility feasibility).
3. **Build the pitch deck** from the Blueprint's executive content (14 slides per the outline).
4. **Stand up the data room** and seed it with the documents listed above.
5. **Agree the Stage-1 term sheet** with investor counsel before any external circulation.

6. **Review the Blueprint** with an independent accountant and securities counsel.

PART VII

Appendices

Supporting reference material: the expanded 300-question diligence set, glossary, source notes, and document control.

Appendix A · Expanded 300-question diligence set

Prepared for conversations with private investors, strategic manufacturing partners, lenders, family offices, and investment committees. Where a question cannot yet be answered with evidence, the answer identifies the planned work. Nothing in this appendix is a representation or warranty.

Section A · Corporate structure and investment readiness (Q1–Q20)

1. **What exactly would investors own?** Shares or other securities in a clearly identified legal entity. Before financing, Creative Design Networks must confirm whether Sphere of Kings is a subsidiary, division, or separate corporation and document the ownership of its assets.

2. **Why is the corporate structure important?** Investors need to know which company owns patents, trademarks, designs, customer contracts, equipment, software, and revenue streams.

3. **What is the total capital request?** Up to $100M, staged by commercial and operational milestones.

4. **Is the $100M required immediately?** No. An initial $2M validation tranche funds the evidence that justifies larger commitments.

5. **What is the current valuation?** No verified independent valuation. A professional valuation would consider product readiness, IP, sales, financial records, and risk.

6. **What valuation is used in the ROI illustrations?** A hypothetical $300M pre-money, giving a $100M investor 25% at $400M post-money.

7. **Is that valuation guaranteed to be accepted?** No. It is a modeling assumption, not an offer or independent valuation.

8. **What is the company's principal business?** Gaming products and technology-enabled manufacturing, with planned expansion into outside contract manufacturing and industrial metal production.

9. **What is the central investment thesis?** A consumer product portfolio plus flexible manufacturing services with shared facilities, people, software, and brand.

10. **What corporate documents are needed?** Formation records, bylaws, cap table, shareholder agreements, board resolutions, tax registrations, corporate policies.

11. **What IP ownership records are required?** Signed assignments for inventions, designs, software, trademarks, artwork, and contractor work.

12. **What financial records are required?** Bank statements, historical statements, outstanding obligations, customer sales, expenses, assets, liabilities.

13. **Should the company obtain audited financial statements?** Yes; timing driven by financing terms and investor requirements.

14. **Who approves major capital purchases?** An appropriately constituted board and management under documented spending authority.

15. **Should investors receive preferred shares?** Likely, with negotiated liquidation preferences, voting rights, anti-dilution, and protections.

16. **Can the company raise equipment debt instead of equity?** Yes, after establishing creditworthiness and repayment capacity. Equipment finance reduces dilution but adds fixed obligations.

17. **Should the company seek strategic investors?** Yes. Investors with manufacturing, distribution, technology, or licensing expertise add commercial value.

18. **Can the company seek international investment?** Potentially, subject to securities, ownership, tax, and regulatory requirements.

19. **What is the first investor milestone?** Demonstrate the flagship product can be manufactured, delivered, and sold at a positive contribution margin.

20. **What makes the company institutionally investable?** Verified financials, credible management, legally controlled assets, transparent reporting, and a commercially justified capital plan.

Section B · Sphere of Kings product strategy (Q21–Q40)

21. **What is Sphere of Kings?** A modular spherical game and puzzle system supporting seven initial experiences and future themed editions.

22. **What are the seven experiences?** Royal Checkers, Imperial Kings, Pre-designed Puzzle, Custom Upload Puzzle, DIY Paint Puzzle, Paintable Royal Checkers, Paintable Imperial Kings.

23. **What is the flagship retail price?** Approximately $179, subject to final product configuration and customer testing.

24. **What is the current manufacturing cost assumption?** Early target of ~$30 per set — must be validated with a complete BOM, labor, rejects, packaging, and overhead.

25. **What is the board-only price?** Approximately $129, subject to final product and channel strategy.

26. **Will accessories be sold separately?** Yes. Replacement pieces, game modules, custom artwork, premium components.

27. **What is the competitive distinction?** Spherical form, modular gameplay, customization, collectibility, potential digital integration.

28. **What customer segments are targeted?** Families, gamers, collectors, puzzle enthusiasts, hobbyists, gift buyers, licensed-merchandise customers.

29. **Will the product be sold internationally?** Potentially, after meeting product safety, labeling, distribution, and consumer-protection requirements.

30. **Will the company create children's editions?** Potentially, with age-appropriate safety testing and compliance.

31. **Can schools use the product?** Yes, if educational editions demonstrate learning value and safety.

32. **Can the company create corporate promotional editions?** Yes, with approved logos, designs, and commercial manufacturing terms.

33. **Will custom artwork be accepted?** Yes, subject to technical requirements and IP verification.

34. **Can customers submit original puzzle designs for licensing?** That is a proposed creator program under per-design contracts.

35. **Can the company produce limited editions?** Yes, using numbered runs or defined production quantities.

36. **Could the company manufacture metal editions?** Potentially, where weight, cost, finish, safety, and demand justify the product.

37. **Could metal pieces command premium pricing?** Possibly, but willingness to pay must be tested rather than assumed.

38. **How will product durability be validated?** Repeated assembly testing, drop testing, wear evaluation, material inspection, customer-use trials.

39. **How will product defects be tracked?** By lot, design, machine, material, failure category, and customer complaint.

40. **What is the product division's five-year ambition?** Illustrative $100M in annual gaming revenue through diversified products and channels.

Section C · Industrial warehouse development (Q41–Q60)

41. **Why establish a large warehouse?** To integrate equipment, assembly, finishing, inventory, QC, engineering, and shipping in one controlled production environment.

42. **How large should the first facility be?** An illustrative 150,000 sq. ft. is evaluated here; actual size must follow capacity and cost analysis — likely smaller for the first site.

43. **Should the company lease or purchase?** Compare total occupancy, flexibility, financing, property taxes, maintenance, and opportunity cost of capital.

44. **What is the facility budget?** $12M initial occupancy, improvements, utilities, and infrastructure.

45. **Will the warehouse support 24-hour operations?** Potentially, with safe staffing, maintenance coverage, and economically justified shifts.

46. **What electrical systems are needed?** Industrial distribution sized to connected loads, cooling, compressed air, and future expansion.

47. **What ventilation is required?** Process-specific for polymer emissions, metal powders, and post-processing.

48. **What fire safety systems are required?** Detection, suppression, material segregation, emergency procedures, specialized controls where applicable.

49. **Will there be separate metal manufacturing areas?** Yes, as required by hazard assessment and codes.

50. **Will the facility have a testing laboratory?** Yes, for inspection, metrology, and material/component testing.

51. **Will there be a dedicated engineering department?** Yes, for product design, manufacturing engineering, process development.

52. **Will the warehouse have automated storage?** Potentially, if throughput and inventory justify the investment.

53. **Will forklifts and material-handling equipment be needed?** Yes, per product weight, layout, and safety.

54. **How will equipment placement be determined?** Process flow, utility connections, maintenance clearances, material movement, and worker safety.

55. **How will the site be secured?** Controlled access, inventory tracking, cameras where appropriate, and cybersecurity controls.

56. **How will utility outages be handled?** Contingency procedures, backup power for critical systems, production-recovery plans.

57. **Will the facility include customer demonstration space?** Potentially, to support industrial sales and strategic partnerships.

58. **What is the most important site-selection factor?** Total risk-adjusted operating economics — utilities, permits, labor, logistics, expansion capability.

59. **When should the company commit to a large facility?** After validating demand, obtaining supplier and contractor quotations, and completing feasibility review.

60. **How will facility success be measured?** Operating cost per accepted unit, throughput, utilization, safety, delivery performance, cash return on invested capital.

Section D · Polymer 3D-print farm operations (Q61–Q80)

61. **What printers will be used initially?** Compatible Bambu Lab printers for suitable polymer production; other industrial systems as justified.

62. **How much capital is allocated to polymer manufacturing?** $12M.

63. **How many printers will be purchased?** Final count depends on actual quotations, machine performance, staffing, and committed demand.

64. **Will the company purchase printers in batches?** Yes, to avoid idle capacity and incorporate early lessons.

65. **Can the farm operate continuously?** Potentially, subject to reliability, safety, maintenance, and staffing.

66. **Will multicolor printing be supported?** Yes, using validated color workflows and compatible equipment.

67. **Will customers upload printable files?** Yes, through a secure submission and technical-review process.

68. **Will the farm accept outside orders?** Yes, for approved parts and products.

69. **Can it manufacture replacement parts?** Yes, where material and mechanical specs are appropriate.

70. **Can it produce commercial prototypes?** Yes, including functional and presentation prototypes.

71. **Will the farm support small production batches?** Yes, a natural application for flexible additive manufacturing.

72. **Can the farm produce large production runs?** Potentially, though injection molding may be more economical for standardized parts.

73. **What is the main production constraint?** Accepted output through the complete process, not merely printer count.

74. **How will failed prints be reduced?** Process validation, material control, monitoring, maintenance, defect analysis.

75. **How will machine maintenance be organized?** Preventative schedules, spares, service records, downtime tracking.

76. **Will printers be remotely monitored?** Where compatible, using secure software and sensors.

77. **How will quality be measured?** Dimensional accuracy, strength, finish, color consistency, customer acceptance.

78. **Will the company recycle polymer waste?** Where technically appropriate and economically viable.

79. **How will pricing be calculated?** Machine time + material + labor + post-processing + rejects + depreciation + overhead + required margin.

80. **What is the expansion rule?** Add capacity only when incremental orders and utilization justify the equipment's full lifecycle cost.

Section E · Metal additive manufacturing (Q81–Q100)

81. **Why enter metal manufacturing?** To serve specialized industrial markets and extend beyond consumer plastic products.

82. **What is the metal budget?** $18M.

83. **What products could be made?** Tooling, fixtures, prototypes, complex components, qualified specialized production parts.

84. **Which metals?** Aluminum, stainless steel, titanium, and other compatible alloys per equipment and demand.

85. **What processes?** Industrial additive including LPBF; others considered where suitable.

86. **Will metal require CNC finishing?** Often, depending on tolerance, surface finish, product.

87. **Will metal parts require heat treatment?** Some, per material and application.

88. **Will powder recovery be needed?** Yes, for applicable powder-based processes.

89. **Will specialized ventilation and fire protection be required?** Yes, per process hazards, materials, local codes.

90. **Will certified personnel be needed?** Yes — qualified operators, engineers, inspectors, safety staff.

91. **Can aerospace customers be served?** Potentially, after demanding quality, documentation, and customer qualification.

92. **Can automotive customers be served?** Yes, for suitable products with customer approval.

93. **Can medical-device manufacturers be served?** Potentially; regulated applications require additional controls.

94. **Can consumer metal collectibles be produced?** Yes, if pricing and demand justify the process.

95. **Should metal equipment be purchased before contracts?** Generally no — avoid large purchases without credible demand and a validated case.

96. **Could metal work be initially subcontracted?** Yes, to test demand and develop customer relationships before buying.

97. **How will metal jobs be quoted?** Material, build time, supports, post-processing, testing, inspection, scrap, overhead.

98. **Greatest metal manufacturing risk?** High fixed investment combined with inadequate utilization or unsuccessful customer qualification.

99. **Year-5 metal revenue ambition?** Illustrative $50M annually.

100. **What must happen for that target to be credible?** Qualified sales pipeline, validated machine economics, production capacity, repeat customer orders.

Section F · CNC, injection molding and high-volume manufacturing (Q101–Q120)

101. **Why use injection molding?** It can substantially reduce per-unit cost for standardized plastic products once tooling is recovered.

102. **What is the mass-production budget?** $12M across molding, CNC, assembly, tooling, packaging.

103. **How will IM equipment be selected?** Part geometry, material, clamp force, cycle, quality, tooling compatibility, total cost.

104. **Will molds be manufactured internally?** Potentially, once volume and capability justify a toolroom.

105. **What will CNC produce?** Metal and plastic components, fixtures, prototypes, molds, precision-finished parts.

106. **Can CNC support metal printing?** Yes, machining critical surfaces, threads, tolerance features.

107. **Will robots assist production?** Where repeatable tasks and payback justify automation.

108. **Can automated systems remove finished parts?** Potentially, per equipment compatibility and safety.

109. **Will conveyors be used?** Where assembly and packaging volumes justify.

110. **Will packaging be automated?** Potentially — labeling, weighing, carton forming, sealing, inspection.

111. **How will production lines be designed?** Around bottleneck capacity, flow, safety, changeover time, quality.

112. **What is a production bottleneck?** The operation that limits overall accepted output.

113. **How identified?** Measured cycle times, WIP, downtime, throughput analysis.

114. **How reduced?** Standardized fixtures, planning, documented settings, efficient tooling.

115. **Can one facility handle multiple product categories?** Yes, provided processes, QC, and schedules are compatible.

116. **Can outside businesses request mass production?** Yes, with engineering review, quotations, MOQs, contracts.

117. **Tooling ownership?** Contracts specify SOK-owned or customer-owned tooling.

118. **Depreciation policy?** Appropriate accounting with realistic useful-life assumptions.

119. **What determines equipment payback?** Incremental after-tax cash generation, initial investment, maintenance, replacement.

120. **When should high-volume production expand?** When contracted demand, yields, and financial analysis support additional equipment.

Section G · AI, robotics and manufacturing technology (Q121–Q140)

121. **Technology budget?** $10M.

122. **Central software objective?** Connect design intake, quoting, scheduling, manufacturing, QC, inventory, shipping.

123. **Will AI create manufacturing quotes?** It may assist, subject to validated pricing rules and engineering review.

124. **Will AI assign production jobs?** Proposed feature of the MES.

125. **Can AI detect failed prints?** Potentially, using cameras, machine data, trained inspection models.

126. **Can AI predict machine failures?** Potentially, after sufficient reliable maintenance and operating data.

127. **Will platform support multiple facilities?** Yes — architected for centralized management of distributed sites.

128. **Integrate with Bambu Lab printers?** Subject to interfaces, compatibility, manufacturer terms.

129. **Integrate with metal printers?** Where compatible industrial interfaces exist.

130. **Can customers monitor production?** Approved status updates without confidential detail.

131. **Material inventory management?** Yes — lots, consumption, reorder points, availability.

132. **Track royalties?** Yes, per executed creator and licensing agreements.

133. **Manufacturing reports?** Throughput, utilization, defects, labor efficiency, profitability.

134. **Will robots use the same platform?** Potentially, through approved integrations and safety systems.

135. **Support external manufacturing partners?** Yes, through secure order routing and partner permissions.

136. **Build own e-commerce?** Integrate established commerce infra while developing specialized features internally.

137. **Digital gaming in this division?** Yes, subject to a separately validated product roadmap.

138. **Outsourced software development?** Possible, with clearly documented IP ownership.

139. **Software security testing?** Access reviews, vulnerability assessments, backups, monitoring, incident response.

140. **How is tech investment evaluated?** Incremental revenue, cost reduction, quality, lower downtime, measurable customer value.

Section H · Licensing and creator marketplace (Q141–Q160)

141. **What is the creator marketplace?** A proposed platform where eligible creators submit designs for review, manufacturing, licensing, and sale.

142. **Can customers submit artwork?** Yes, subject to technical requirements and proof of rights.

143. **Will every submission be accepted?** No. Submissions must meet legal, technical, safety, commercial standards.

144. **Profit-sharing model?** 50/50 split of contractually defined net profit for eligible creator products.

145. **Deductions before profit sharing?** Contract defines eligible manufacturing, marketing, fulfillment, platform, royalty, and other deductions.

146. **Will creators receive financial reports?** Yes, with transparent sales and royalty accounting.

147. **Creator ownership of designs?** Established contract-by-contract; a non-exclusive license is appropriate for many submissions.

148. **Exclusive designs?** Yes, where exclusivity is commercially justified.

149. **Multiple designs per creator?** Yes, potentially through portfolio packages.

150. **Setup fees?** Optional services may carry disclosed fees corresponding to real deliverables.

151. **Design assistance offered?** Potentially — engineering, modeling, artwork preparation.

152. **Prototyping offered?** Yes, using in-house or qualified partner capabilities.

153. **Can businesses license logos?** Yes, where they have the rights.

154. **Major entertainment franchises?** Potentially, through negotiated licensing.

155. **Sports teams?** Yes, with permissions and commercial terms.

156. **Preventing unauthorized artwork?** Rights declarations, review procedures, complaints handling, contract enforcement.

157. **Territory in agreements?** Yes, including markets and permitted channels.

158. **Duration in agreements?** Yes, with renewal, termination, reversion.

159. **Licensing revenue target?** Combined licensing + digital at $20M by Year 5 (illustrative).

160. **Competitive objective?** Make it easier for authorized creators to turn designs into manufactured products with transparent compensation.

Section I · Patents, legal, compliance (Q161–Q180)

161. **Patent protection available?** Potential utility patents for qualifying technical inventions and design patents for eligible ornamental designs.

162. **Can the spherical board be patented?** Possibly, depending on novelty and non-obviousness.

163. **Can game rules be patented?** Certain qualifying technical implementations may be protectable; abstract rules alone are not automatically patentable.

164. **Will patents cover every future design?** No. Protection depends on the design's nature and applicable IP law.

165. **Will trademarks be registered?** Yes — clearance and registration for appropriate brand identifiers.

166. **Copyrights?** Where appropriate for original artwork, software, and protected works.

167. **Confidentiality agreements?** Yes, where necessary to protect non-public information.

168. **Developer IP assignments?** Yes, clarifying ownership of company-funded work.

169. **Contractor manufacturing agreements?** Yes — confidentiality, quality, delivery, liability, ownership.

170. **Product liability insurance?** Yes, with coverage appropriate to products and markets.

171. **Additional insurance for metal manufacturing?** Likely, depending on equipment, hazards, customer requirements.

172. **Environmental permits?** Potentially, based on emissions, materials, waste, activities.

173. **Workplace safety programs?** Yes — training, hazard assessments, PPE, emergency procedures.

174. **Product safety certifications?** Depends on age grading, category, destination market.

175. **Cybersecurity policies?** Yes, especially when handling customer files and proprietary designs.

176. **Securities counsel?** Yes, to structure the offering and ensure compliance.

177. **Advertise guaranteed returns?** No. Proposed equity returns are uncertain and not guaranteed.

178. **Licensing partner due diligence?** Often — financial, legal, quality, brand compliance.

179. **Legal budget?** $4M across IP, legal, compliance, testing, insurance.

180. **Principal legal objective?** Build a defensible, compliant business reducing risk of disputes, product claims, and financing problems.

Section J · Sales, distribution and customer acquisition (Q181–Q200)

181. **Main sales channels?** DTC, retail, wholesale, B2B manufacturing, licensing, digital products.

182. **Kickstarter remains important?** Yes, as initial launch and demand-validation channel.

183. **Kickstarter launch target?** November 19, 2026.

184. **Official Kickstarter funding goal?** $10,000.

185. **Founder's personal campaign ambition?** $30M — aspirational only, not a forecast.

186. **Jellop marketing?** Founder reports a relationship; investors should verify the contract and campaign responsibilities.

187. **Sales through Sphereofkings.com?** A central proposed direct-sales channel; currently in Kickstarter-only mode.

188. **Specialty toy retailers?** Yes, after validating quality and wholesale economics.

189. **National retail chains?** Yes, once capacity and demand justify SKU-count discipline.

190. **International distributors?** Potentially, after country-specific demand and compliance analysis.

191. **Industrial customer acquisition?** Technical sales, outreach, referrals, trade shows, procurement channels.

192. **Dedicated industrial sales reps?** Yes, as contract-manufacturing division develops.

193. **Industrial sales vs consumer?** Industrial requires technical qualification, quotations, specifications, quality docs, contracts.

194. **Volume discounts?** Yes, where lower unit costs and minimum orders justify.

195. **Recurring contracts?** Yes, to improve revenue visibility and utilization.

196. **Prototype-only customers?** Yes, where profitable and aligned with capabilities.

197. **Design-to-production packages?** Potentially — engineering, prototyping, tooling, manufacturing.

198. **Marketing performance measurement?** Acquisition cost, conversion, repeat orders, gross margin, contribution after selling costs.

199. **Year-5 gaming revenue ambition?** $100M (illustrative).

200. **Overall commercial objective?** Diversified recurring demand without excessive dependence on a single campaign, customer, or channel.

Section K · Materials, inventory, logistics (Q201–Q220)

201. **Capital for materials and WC?** $10M.

202. **Raw materials needed?** Polymer filaments/powders, metal feedstock, purchased components, magnets, adhesives, packaging, finishing supplies.

203. **Single supplier?** No — diversification where practical.

204. **Bulk purchasing?** Yes, after validating consumption and storage.

205. **Inventory tracking?** Centralized system covering receipt, storage, consumption, lots, FG.

206. **Special storage?** Yes — moisture sensitivity, flammability, powder hazards.

207. **Metal powder handling?** Yes — qualified safety procedures and environmental controls.

208. **Backup inventory?** For critical materials, based on lead times and risks.

209. **Supplier performance evaluation?** Cost, delivery, quality, documentation, responsiveness.

210. **Ship internationally?** Potentially, after establishing customs, compliance, landed-cost processes.

211. **3PL providers?** Where outsourced fulfillment is more efficient than internal operations.

212. **Dedicated shipping department?** Yes, if order volume supports internal fulfillment.

213. **Packaging testing?** Shipping simulation, drop tests, vibration, damage monitoring.

214. **Industrial packaging?** Yes, based on dimensions, finish, contamination sensitivity, customer requirements.

215. **Returns handling?** Documented authorization, inspection, repair, replacement, refund.

216. **Shipping cost impact?** Included in contribution-margin calculations by product and customer.

217. **Inventory as cash-flow concern?** Potentially — especially when scaling wholesale orders and metal

materials.

218. **Receivables management?** Credit policies, customer deposits, payment terms, collections monitoring.

219. **Customer deposits?** Potentially, for custom tooling, specialized manufacturing, large commitments.

220. **Supply-chain objective?** Reliable fulfillment with disciplined inventory, traceability, controlled WC.

Section L · Hiring, workforce, management (Q221–Q240)

221. **Workforce allocation?** $7M in the proposed capital budget.

222. **Need CFO?** Yes — planning, accounting, controls, financing, investor reporting.

223. **Need COO?** Yes — ideally with industrial manufacturing and multi-site experience.

224. **Need CTO?** Yes — software, cybersecurity, automation, engineering architecture.

225. **Manufacturing engineering director?** Yes — production methods, capacity models, process controls.

226. **Metal manufacturing director?** Yes — relevant technical qualifications and industrial safety experience.

227. **CNC machinists?** Yes, as equipment and contracts justify.

228. **IM technicians?** Yes — setup, tooling, production, maintenance.

229. **Polymer printing techs?** Yes — print prep, machines, materials, finishing.

230. **Quality engineers?** Yes — inspection, traceability, corrective action.

231. **Safety / environmental specialists?** Yes — especially before metal expansion.

232. **Warehouse / fulfillment?** Yes, matched to throughput.

233. **B2B sales staff?** Yes — build qualified industrial pipeline.

234. **Licensing specialists?** Yes — manage creator agreements and partners.

235. **Customer support?** Yes — appropriate staffing for consumer and industrial.

236. **Technical training?** Yes — equipment operation, QC procedures, workplace safety.

237. **Employee incentives?** Potentially, linked to productivity, quality, safety, financial performance.

238. **Headcount determination?** Capacity requirements, labor standards, shifts, revenue forecasts.

239. **Does $7M cover all future payroll?** No — ongoing payroll funded from operations and WC, not the capital envelope.

240. **Management objective?** Experienced leadership and accountable operating culture that scales beyond the founder.

Section M · Financial modeling and investor returns (Q241–Q260)

241. **Five-year revenue target?** Illustrative $250M by Year 5.

242. **Gaming share?** $100M in the illustrative model.

243. **Polymer / mass production share?** $80M.

244. **Metal share?** $50M.

245. **Licensing & digital share?** $20M.

246. **Year-5 EBITDA target?** $50M, or 20% of revenue (illustrative).

247. **Verified forecast?** No — an ambitious planning scenario requiring operational and commercial validation.

248. **Investor ownership %?** Illustrative 25% for $100M at a hypothetical $300M pre-money.

249. **Outcome at $500M exit?** $125M to 25% investor → 25% total ROI.

250. **Outcome at $1B exit?** $250M → 150% total ROI.

251. **Outcome at $2B exit?** $500M → 400% total ROI.

252. **Outcome at $3B exit?** $750M → 650% total ROI.

253. **Annualized at $1B exit (5y)?** ~20.1% under the stated assumptions.

254. **Returns guaranteed?** No. Actual returns may be substantially lower or negative.

255. **Equipment ROI evaluation?** Discounted incremental cash flow, payback, utilization, maintenance, residual.

256. **Profitability measurement?** Financial statements with direct costs, OpEx, D&A, financing, taxes.

257. **Cash runway?** Unrestricted cash + expected collections + committed financing − projected net outflows.

258. **Investor monitoring?** Regular reports: revenue, margins, EBITDA, cash, capex, covenants.

259. **Biggest financial risk?** Expanding fixed costs faster than profitable customer demand.

260. **Financial strategy?** Deploy against validated demand, preserve liquidity, prioritize sustainable cash over headline revenue.

Section N · Governance, investor protection, risk (Q261–Q280)

261. **Board of directors?** Appropriately constituted to oversee financing, strategy, executive performance, major investments.

262. **Investor governance rights?** Potentially — negotiated board representation and protective provisions.

263. **Approval for major purchases?** Yes, under defined capex authorization limits.

264. **Annual budget?** Yes, with monthly tracking and periodic reforecasting.

265. **Independent accounting controls?** Yes — reconciliations, purchasing controls, SoD.

266. **Investor funds tracking?** Yes, project accounting and approved allocations.

267. **Audits?** As appropriate for financing agreements and reporting obligations.

268. **Kickstarter demand lower than expected?** Scale conservatively; defer unsupported expansion.

269. **Manufacturing defects?** Investigate root causes, correct processes, implement customer remedies.

270. **Metal demand weak?** Avoid further equipment purchases; consider subcontracting or alternative markets.

271. **Major industrial customer cancels?** Reassess capacity, receivables, staffing, spending.

272. **Raw material cost increase?** Review pricing, suppliers, design, operating efficiency.

273. **Miss revenue target?** Update plan, reduce discretionary spend, protect liquidity.

274. **Equipment underutilized?** Investigate pricing, pipeline, process mix, potential asset redeployment.

275. **Critical machine failure?** Maintenance procedures, backup capacity, qualified partners, customer communication.

276. **Cybersecurity incident?** Activate IR; contain; investigate; restore; comply with notification rules.

277. **IP challenge?** Legal review, contract provisions, insurance, product modifications.

278. **Could investors lose everything?** Yes. Early-stage equity investment carries substantial risk.

279. **Most important investor safeguard?** Independent due diligence + milestone-based financing + transparent governance.

280. **Risk-management principle?** Protect people, customer obligations, IP, and cash before pursuing aggressive expansion.

Section O · Global expansion and long-term vision (Q281–Q300)

281. **Year-1 objective?** Validate product economics, fulfill initial orders, establish pilot production, build investor-ready records.

282. **Year-2 objective?** Launch right-sized warehouse; expand profitable consumer and industrial sales.

283. **Year-3 objective?** Develop high-volume manufacturing and qualified metal production where demand is established.

284. **Year-4 objective?** Expand successful capacity; pursue additional regional/international markets.

285. **Year-5 objective?** Operate a diversified gaming and manufacturing enterprise capable of sustainable operating earnings.

286. **Expand beyond the U.S.?** Potentially, after establishing reliable domestic operations and evaluating international demand.

287. **Priority international markets?** Ranked by demand, logistics, regulation, IP protection, operating economics.

288. **International warehouses?** Only where regional production or distribution offers demonstrable economic advantage.

289. **Franchise print farms?** Potentially, only after standardizing operations and addressing franchise/licensing requirements.

290. **Acquire existing manufacturers?** Potentially, where acquisition economics and integration risks are favorable.

291. **Expand into additional materials?** Yes, as capability and demand justify.

292. **Advanced robotics?** Potentially, focusing on measurable productivity and quality benefits.

293. **Industrial certifications?** Yes, where required by customers and target markets.

294. **Global inventor marketplace?** A proposed long-term objective connecting approved designs with manufacturing and distribution.

295. **New game experiences?** Yes, guided by customer feedback and commercial performance.

296. **Could SOK become a recognized international brand?** Potentially, through sustained quality, satisfaction, distribution, marketing.

297. **Could manufacturing become larger than gaming?** Yes, if industrial demand and contract economics support it.

298. **Could the company reach a billion-dollar valuation?** Potentially, but requires financial performance, growth, and market conditions sufficient to justify that value.

299. **Ultimate measure of investment success?** Positive risk-adjusted investor returns supported by sustainable operations, credible governance, and long-term customer value.

300. **Final $100M proposition?** SOK proposes to combine a distinctive gaming platform with scalable polymer manufacturing, high-volume production, industrial metal capability, AI-assisted operations, and creator licensing — financed in disciplined stages tied to measurable results.

Appendix B · Glossary and source notes

Key terms

TERM	MEANING
Additive manufacturing	Building a part by adding material layer-by-layer (3D printing), as opposed to subtractive (machining) or formative (molding, casting) processes.
LPBF	Laser Powder-Bed Fusion — a metal additive process that melts metal powder layer-by-layer using a laser.
FDM / FFF	Fused Deposition / Fused Filament Fabrication — a polymer additive process that extrudes molten plastic filament.
SLS / MJF	Selective Laser Sintering / Multi Jet Fusion — polymer powder-bed processes used for functional parts.
BOM	Bill of Materials — the full list of components, materials, and quantities needed to build one unit of a product.
MES	Manufacturing Execution System — software that coordinates jobs, machines, operators, materials, and quality on the shop floor.
CNC	Computer Numerical Control — automated machining equipment (mills, lathes, routers) driven by code.
OEE	Overall Equipment Effectiveness — a composite measure of availability × performance × quality.
Contribution margin	Revenue less the direct variable costs of producing that revenue; the amount each additional unit contributes to fixed costs and profit.
EBITDA	Earnings Before Interest, Taxes, Depreciation and Amortization — a proxy for operating profitability.
Pre-money / post-money valuation	Pre-money is the valuation of the company immediately before a financing; post-money is pre-money plus the new capital raised.
Dilution	The reduction in existing shareholders' percentage ownership that results from issuing new shares.
Liquidation preference	A right of preferred shareholders to receive a defined return before common shareholders in a sale or dissolution.
FTO memo	Freedom-to-operate memorandum — a legal analysis of whether making or selling a product would infringe third-party IP rights.
ISO 9001	An internationally recognized quality-management-system standard.
Working capital	Short-term assets (inventory, receivables) less short-term liabilities (payables) — the cash tied up in operations.

TERM	MEANING
Milestone-gated financing	Capital released in tranches contingent on achieving specific operational or commercial milestones.

Source notes

This Blueprint synthesizes information from the existing Sphere of Kings codebase (`nextjs/`, `content/`, `site/`), the existing Investor Master Blueprint draft provided by the founder, and the founder's latest instruction regarding the proposed $100M capital raise. Full provenance is maintained in `SOURCE-AND-ASSUMPTION-REGISTER.md`. Visual references in the original draft to third-party imagery (Forgely, 3D Printing Industry, Innovise IT) have been removed; this document uses only SOK-owned visual assets and schematic diagrams prepared for this document.

Appendix C · Document control

Version history

VERSION	DATE	DESCRIPTION	AUTHOR
v1.0	2026-11-03	Initial Blueprint drafted from existing SOK materials and founder instruction; companion register, checklist, executive summary, and pitch-deck outline created.	Blueprint preparation team

Companion documents

DOCUMENT	PURPOSE	FILENAME
Executive summary	Standalone summary for investor communications	`EXECUTIVE-SUMMARY.md`
Source & assumption register	Line-by-line provenance of every material claim	`SOURCE-AND-ASSUMPTION-REGISTER.md`
Investor readiness checklist	Tracking list of everything required before external submission	`INVESTOR-READINESS-CHECKLIST.md`
Pitch deck outline	Recommended 14-slide structure for the standalone deck	`PITCH-DECK-OUTLINE.md`
PDF export script	Node + Playwright script to render this HTML to A4 PDF	`build-pdf.mjs`
